

Meeting Malawi's FP 2020 Contraceptive Prevalence Goal: How Will We Get There?

National Post–FP 2020 Summit Meeting Lilongwe, Malawi, January 23, 2013

Jane Wickstrom, MA and Melanie Yahner, MPH

Managing Partner: EngenderHealth; Associated Partners: FHI 360; Futures Institute; Johns Hopkins Bloomberg School of Public Health Center for Communication Programs; Meridian Group International, Inc.; Population Council

Presentation Overview

- EngenderHealth's Reality √ Tool
- Two future scenarios of CPR growth using Reality √:
 - What will it take for Malawi to reach its family planning goals?
 - What is the impact in terms of service needs?
 - What are the health benefits for women and families?
 - What will it cost?
- Programmatic considerations
- Audience reaction to this information

What Is the Reality ✓ Tool?

Provides program needs/impact data

- Tests multiple scenarios in minutes → "What if...I change my CPR Goal?"
- Flexible level of analyses: national, regional, district, site

User-friendly

- Excel-based worksheets, graphs
- User's Guide (English and French)
- Minimal data requirements
 - CPR data
 - Population data

Use of All Women of Reproductive Age

In Malawi, it is more appropriate to use ALL women in our analysis, since:

- Only 67% of Malawian women ages 15-49 are married.
- Family planning use in Malawi is not only among married women: 47% of sexually active unmarried women use contraception.
- So, nearly 90,000 women would not be counted those sexually active never-married women (5.3%) or divorced/separated/widowed women (9.5%).

Projections of only married women would underestimate the resources and efforts needed to reach the 60% CPR goal.

Using "All Women" Captures Youth

- Malawian youth are sexually active:
 - 250,000+ Malawian women aged
 15–19 are mothers or are pregnant (26%).
 - 190,000+ Malawian women aged
 15–19 have ever used a modern family planning method (20%),
 - ≤90,000 Malawian women aged
 15–19 currently use a modern family planning method (9%),

"Not All Family Planning Methods Are the Same"

The relative effectiveness of various methods at preventing pregnancy:

Method	No. of unintended pregnancies among 1,000 women in 1st year of typical use		
No method	850		
Withdrawal	220		
Female condom	210		
Male condom	180		
Pill	90		
Injectable	60		
IUD (CU-T 380A/LNG-IUS)	8/2		
Female sterilization	5		
Vasectomy	1.5		
Implant	0.5

Family Planning Needs and Gaps to Be Filled

- Unmet need is still high, at 19% among all women aged 15–49.
- More women want to limit births (28%) than space the next birth (26%).
- The average age at which demand for limiting <u>exceeds</u> demand for spacing is 29 years of age.
- Long-acting and permanent methods (LA/PMs) are underused.
- Myths and rumors impede the use of all family planning methods.

But....family planning is considered a "norm" in Malawi, paving the way for increased use of modern methods.

Future Scenarios for Family Planning Results

Scenario 1: Continue current increase 1.7% annually

Scenario 2: Meet 60% goal by 2020 by increasing 2.7% annually + increase percentage LA/PM users

Note: Scenario #2 is 1.5 times the current annual CPR increase of 1.7% (among all women).

Expanding Contraceptive Choices

Adding broad choices of methods will better suit couples diverse needs at each stage of their reproductive lives.

High Continuation Shows Popularity

% of women or men **continuing** family planning methods at one year (worldwide)

Tubal ligation	~100%
Vasectomy	~100%
Implants	94%
IUD	84%
Pill	52%
Injectobles	51%
Injectables	51%
Periodic abstinence	51%

Family Planning Prevents Pregnancies

Unintended pregnancies averted

→ Continue Current Increase (1.7%)

→60% Goal

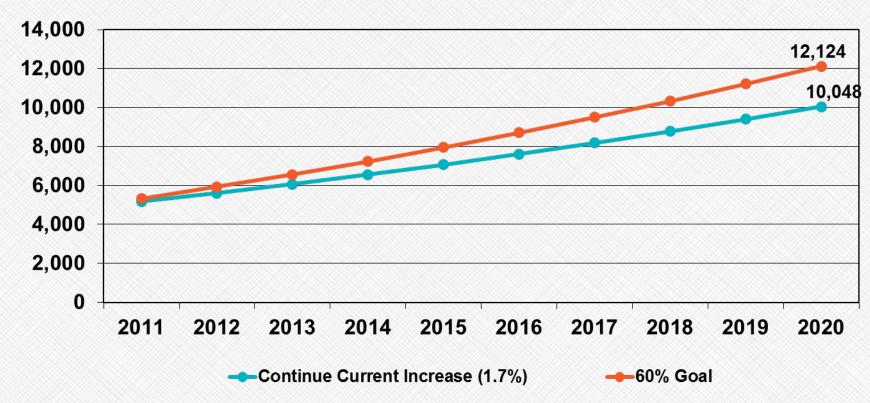

Family Planning Saves Lives

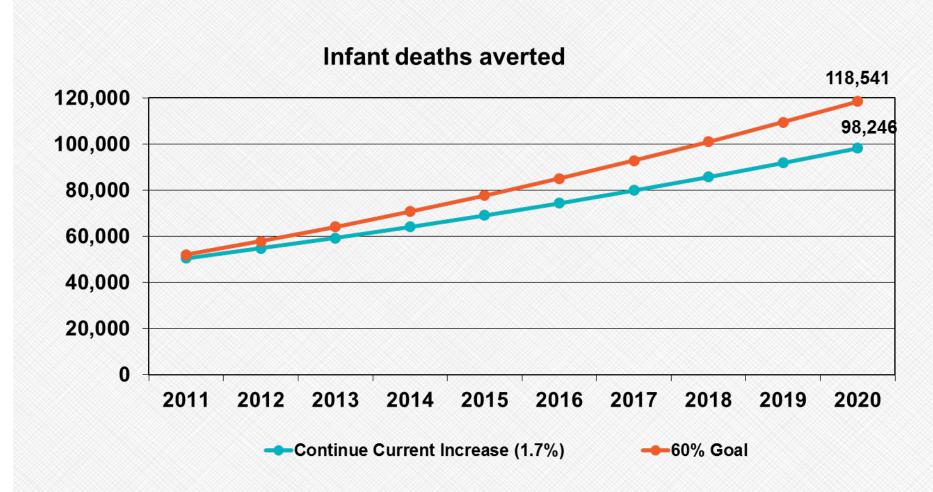

Family Planning Saves Lives

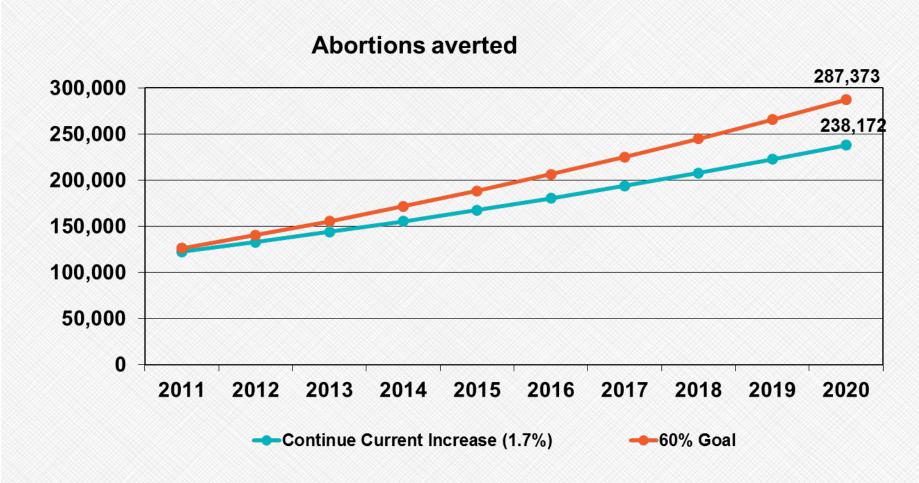

Family Planning Saves Lives

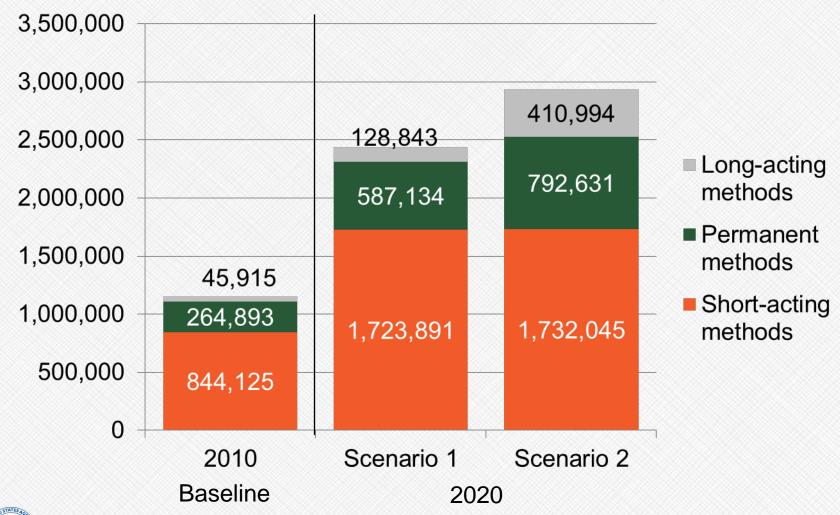

Programmatic Considerations

Total Family Planning Users by Scenario

Caseload at Baseline and in 2020

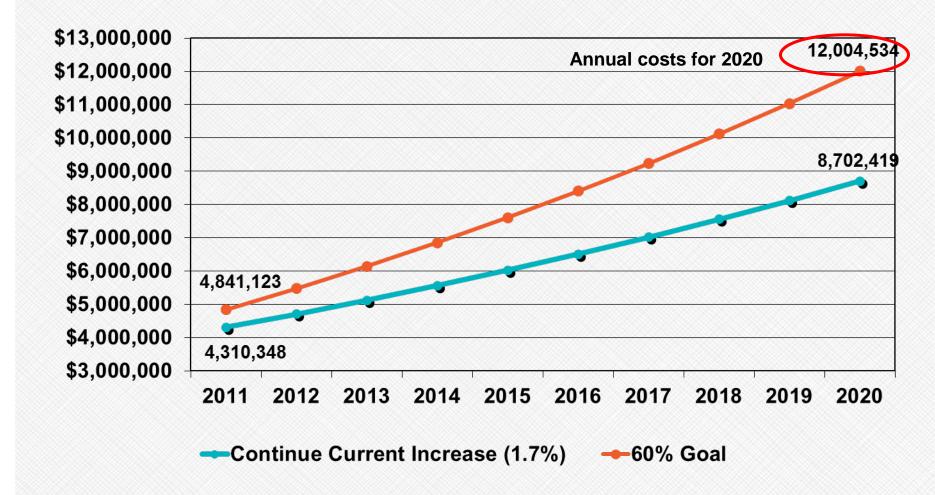

Average number of clients per facility per month				
	Baseline	2020		
	2010	Scenario 1	Scenario 2	
Pill	34	62	102	
Injectable	348	682	628	
Male condom	52	113	124	
Female condom	2	6	15	
Implant	3	8	23	
IUD	4	11	78	
Female sterilization	52	141	188	

What Will the Scenarios Cost? Annual contraceptive, equipment, and supply costs

Summary

- If Malawi meets the 60% goal by 2020:
 - IMPACT
 - More than 16 million unintended pregnancies will be averted by 2020.
 - More than 84,000 maternal deaths will be averted by 2020.

RESOURCES:

- > More than 1.7 million women will use short-acting methods.
- > More than 410,000 women will use IUDs or implants.
- Nearly 800,000 women will rely on permanent methods.
- Many more clients will have to be served (for example, 628 injectable clients per facility per month).

Programmatic Considerations for the Future

- The MOH recognizes that LA/PMs are key to program success and partners should continue to support this goal.
- Shifting the method mix will require investments in: training; services; stocks of IUDs and implants; supportive policies; demand generation; community involvement; and champions at all levels.
- Need to investigate the many reasons why injectables are popular. How can we apply lessons learned from injectable expansion?
- The price of Jadelle implants was recently lowered which opens opportunity for implant expansion.
- The Bellagio meeting on FP Rights and Choice declared that "choice may be at risk when one method has a 50% dominance." In Malawi, injectables are 60% of all modern method use.

The Future: How to Meet FP Goals?

To meet the demand for family planning now, and in the future....

What will the Malawi program need to do?
